DETAILED ACTION

Drawings

1. Figures 1 and 6 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). Corrected drawings in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. The replacement sheet(s) should be labeled "Replacement Sheet" in the page header (as per 37 CFR 1.84(c)) so as not to obstruct any portion of the drawing figures. If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claim 11 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Specifically, claim 11 recites the limitation "wherein said signal waveform results from a channel bit stream transmitted over the channel, that has been encoded by means of the method of claim 10". However, it is not clear as to which feature of claim 10 encodes the channel bitstream. Essentially, nowhere in claim 10 recites encoding data information. Hence, this renders claim indefinite.

Allowable Subject Matter

4. In regards to claim 1, none of the reference of record alone or in combination discloses or suggests an apparatus for creating a substantially DC-controllable channel bitstream based upon a channel code, representative of a modulated signal received via a channel, the apparatus comprising means for receiving data representative of a nominal modulation transfer function or impulse response function of said channel, **means for generating a synthetic high frequency signal waveform using said nominal modulation transfer function or impulse response function, means for performing threshold detection in respect of said synthetic high frequency signal waveform to produce intermediate channel bits, and means for computing a running digital sum using said intermediate channel bits.**

Claims 2-10 depend from claim 1 or include similar features. Accordingly, claims 1-10 are allowed.

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Ikeda et al. (US 6,031,173) is cited because Ikeda et al. teach an apparatus for generating musical tones using impulse response signals.

Rapp (US 2006/0133252) is cited to show a related art reference that shows an electronic circuit for decoding a read signal from a storage medium, comprising a limit equalizer for amplifying high frequency read signal components.

Faroudja (US 7,310,370) is cited to show an apparatus having a synthetic HF generator.
